

the population, and the extent to which the population is able to meet the demand for its own goods and services. This is a complex issue, and one that is currently being debated in the media and in the political arena.

The population is currently growing at a rate of 1.5% per year, and this is expected to continue for the next 50 years. This will result in a population of 1.2 billion in 2050, and 1.8 billion in 2075. This is a significant increase, and it will have a major impact on the world's resources.

The world's resources are currently being used at a rate that is not sustainable. This is due to a number of factors, including the increasing demand for food, water, and energy. The world's food production is currently unable to meet the demand, and this is expected to become a major problem in the future. The world's water resources are also being over-exploited, and this is leading to a shortage of water in many areas.

The world's energy resources are also being over-exploited, and this is leading to a shortage of energy in many areas. The world's energy production is currently unable to meet the demand, and this is expected to become a major problem in the future. The world's energy resources are also being over-exploited, and this is leading to a shortage of energy in many areas.
